Supplemental Installation Instructions for Installing Evaporator Coils in Downflow Position

When AllStyle Coils are installed for counterflow / downflow (air flow throught the top of the "A" or "M") the furnace fan speed must be set to 350 - 375 cfm airflow per nominal ton of air conditioning. Failure to properly adjust the airflow can result in excessive face velocity and cause water to blow off the coil. Always verify that water is not blowing off the coil before leaving the jobsite.

StyleQuest Supplemental Installation Instructions

Refer to the evaporator coil installation instructions provided and shipped with every coil.

Additional instructions required for the StyleQuest coil installation:

* If the coil is to be installed in the horizontal left or right configuration with the coil inside the cabinet measuring 22" or greater in length , then the drip shield provided must be attached to the end of the drain pan at the discharge end of the coil.
